HOLD UP BEAL Ascendeur

Description

Designed to optimise performance when ascending ropes, the HOLD UP is a belay device that combines fluidity of movement, ease of use and robustness. Whether you're working at height, rescuing or caving, it adapts perfectly to the demands of the terrain.

Thanks to its perpendicular fixing hole, the HOLD UP is naturally positioned vertically and flat on the harness. This orientation ensures excellent glide over the rope, reducing friction and facilitating every phase of progression.

The low attachment point on the harness provides increased range of movement, improving performance with every pull and reducing user fatigue. The ergonomically designed, offset cam release lever makes using the rope clamp easier and more intuitive, even when wearing gloves.

The HOLD UP is compatible with all professional harnesses, thanks to the FLAT LINK, an optimised carabiner link that guarantees stable, secure mounting. It can also be paired with the HANDS UP handle, forming a high-performance ensemble for rope ascents.

The design incorporates an all-metal control mechanism, ensuring maximum resistance to wear and long life, even in intensive use or difficult conditions.
