XXL Bariatric Soft Stretcher - PAX 400 kg

Description

The PAX XXL Bariatric Soft Stretcher is designed for the lifting, rescue and transport of overweight and obese patients. Suitable for complex rescue situations, it has a maximum load capacity of 400 kg and provides an especially spacious patient support area. Its multiple carrying handles and extra-wide hand loops allow for a secure two-handed grip and enable several rescuers to work together when lifting and transporting the patient. The handle configuration helps distribute the load efficiently during patient handling.

For secure patient restraint, the stretcher is equipped with a Y-shaped safety harness, featuring padding in the chest and crotch areas to help reduce pressure points during transport.

Made from durable PAX-Plan, a polyester material with a PVC coating on both sides, this bariatric transport stretcher is designed for professional use by emergency medical services, ambulance services, fire and rescue services, and civil protection organisations.

A transport bag is included.
