PAX XL Soft Stretcher - Patient Transport and Rescue up to 250 kg

Description

The PAX XL Soft Stretcher is a versatile solution designed for the transport, lifting and rescue of larger patients or patients requiring a more spacious support surface. Designed for professional use, it is suitable for emergency medical services, ambulance services, fire and rescue services, medical teams and civil protection organisations.

With its extra-large patient support area and 14 robust carrying handles, this soft stretcher enables safe patient handling and allows several rescuers to work together during lifting and transport. The ergonomic handle arrangement helps ensure efficient load distribution and improved handling, particularly in demanding rescue situations.

Made from durable PAX-Plan material, the stretcher is designed to withstand the demands of professional emergency use. Its robust, wear-resistant surface is also easy to clean and maintain. The PAX XL transport and rescue stretcher complies with EN 1865 and is approved for a maximum load of 250 kg. It is supplied with a transport bag for convenient storage and rapid deployment.
