Flexible training manikin for the rescue of polytrauma patients

Description

The polytrauma rescue and evacuation training manikin is made from durable polyester for use in confined space, USAR incidents, chemical and biological hazards, traffic accidents and general handling exercises.
The removable limbs can also be partially attached using the Velcro at the end of the limb to partially attach the limb - in this way the limb may fall off during recovery if a thorough injury assessment is not made by the rescuer.
Anatomically correct weight distribution gives the 'feel' of an unconscious person.
A Polypropylene, plastic sleeve allows the introduction of an impalement - scaffold poles, concrete reinforcing bars and fence posts can all be used for this purpose.
The right arm and leg can be completely or partially detached to provide real interest to your training exercises.
Strong enough to be buried under concrete or steel lintels with no damage.
The Polyester is waterproof, making it suitable for wet or foul scenarios, because it can be more easily cleaned and dried than canvas models.
Soft body joints eliminate the risk of pinch welts and bruising, a common injury when using plastic bodied manikins.
Comes complete with boots and overalls, which are easily replaced if damaged
Constructed in the same flame retardant Polyester (conforms to BS EN ISO 15025:2002, OEKO-TEX® Standard 100 and ISO 17050-1) used in Police ballistic/stab vests.
Protective overalls fitted as standard - constructed in the same flame retardant Polyester (conforms to BS EN ISO 15025:2002).
Padding - 25mm Flame Retardant Polyurethane foam VE38200 (conforms to BS2852:Part 2:1982).

Caractéristiques

- Weight : 30, 50 et 70 kg

- Size : 1,8 m
