Versatile manikin for patient handling training

Description

Patient Handling Manikin was developed to be an effective tool for teaching moving and handling techniques that maintain the safety of the caregiver and dignity of the patient.
Constructed with an elongated plastic spine that allows the manikin to sit upright in bed, a wheelchair or hoist - essentially acting as a conscious patient would.
Constructed with plastic strips in the thigh to prevent too much bend when hoisting.
The arms and legs are detachable at the shoulder and knee respectively, meaning you can simulate an amputee in training.
Additional weight has been added to the bottom area to enable it to sit better in a sling, chair or wheelchair.
Velcro straps at the wrist allow trainers to keep the arms together, strap one arm up in a sling position during hoisting, or to hold onto the sling.
The 30kg manikin comes complete with weighted (with additional grip on the soles) and un-weighted soft feet. The weighted feet are for bed work, or when using a wheelchair. The unweighted are for sling/hoist work.
The 50kg manikin comes with weighted feet only.
Constructed from the same flame retardant material used in Police ballistic/stab vests: (conforms to OEKO-TEX® Standard 100, BS EN ISO 12947-2 & 14116: 2008)- the material is tough, safe to handle and very easy to clean.
The body of the manikin comes as standard in beige.

Caractéristiques

- Weight : 30 et 50 kg
- Size : 1,65 m
